Vour Name			

[5 points] Which of the following descriptions best describes what mystery does?

```
int mystery (int *arr, int n) {

if (n = 1) return arr [0];

int val = mystery (arr + 1), n - 1)

return (arr [0] < val)? arr [0] : val;

have arra-1 minus first element

**Ternary operator 3

Shorthand for if (arr [0] \( \text{Val} \))

return arr [0],

else

(eturn Val;

false

(eturn 3
```

A. find the minimum element of arr B. find the maximum element of arr C. find the the sum of all elements of arr D. sort all elements of arr

1. <u>A</u>

2. [5 points] Which of the following descriptions best describes what mystery does?

```
bool mystery(int n, int i) {

if (n <= 2)

return (n == 2) ? true : false;

if (n % i == 0)

return false;

if (i * i > n)

Tf | 2 7 h
```

return true;

int sort(int \*arr, int n) {

return mystery (n, i + 1);

3. [5 points] Given the following sorting algorithm, determine if it is stable, in-place, both, or neither.

```
[5,3,4,7,2]
               if (n \le 1) return;
               sort(arr, n-1);
               int tmp = arr[n-1];
               int j = n-2;
               while (j \ge 0 \&\& arr[j] > tmp) {
                  arr[j+1] = arr[j];
                  j ---;
               arr[j+1] = tmp;
) suc
 [3,4,5,7,7]
                                  [3,5,5,7,2] [5,5,4,7,2]
                    Charges
  3,4,5,5,7
                                   3,4,5,7,2)[3,5,4,7,2
 [3,4,4,5,7
```

A. stable B. in-place C. both D. neither

In points Solve the following recurrence relation: T(0) = 1; T(n) = T(n − 1) + 3

$$T(n) = T(n-1) + 3$$
  
 $T(n-1) = T(n-2) + 3$   
 $T(n) = [T(n-2) + 3] + 3 = T(n-2) + 6$   
 $T(n-2) = T(n-3) + 3$   
 $T(n) = [T(n-3) + 3] + 6 = T(n-3) + 9$   
 $T(n) = [T(n-3) + 3] + 6 = T(n-3) + 9$ 

A. 3n + 1 B. 3n - 1 C. 3n

5. [10 points] Solve the following recurrence relation: T(1) = 1; T(n) = 2T(n/2) + n

$$T(n) = 2T(\frac{a}{2}) + n$$
 $T(\frac{a}{2}) = 2T(\frac{a}{2}) + \frac{b}{2}$ 
 $T(\frac{a}{2}) = 2T(\frac{a}{2}) + \frac{b}{2}$ 
 $T(n) = 2T(2T(\frac{a}{2}) + \frac{b}{2}) + n$ 
 $T(n) = 2T(2T(\frac{a}{2}) + \frac{b}{2}) + n$ 
 $= 2^{2}T(\frac{a}{2}) + n + n$ 
 $= 2^{2}T(\frac{a}{2}) + n + n$ 
 $= 2^{2}T(\frac{a}{2}) + kn$ 

Assume:  

$$T(\frac{1}{2k}) = T(1) = 1$$
 Then  
 $T(n) = 2^k + (1) + kn$   
 $T(n) = 2^k + (1) + kn$ 

A. n + logn B. nlogn C. n + nlogn D.  $n^2 + nlogn$ 

6. [5 points] Is a linked list the best underlying structure to implement a queue with? Justify your answer.

Yes. Queues have two primary operations: enqueue and dequeue.

LinkedList w/ a tail pointer gives us O(1) cost for both operations, and we can grow to any size with no additional cost.

A. Yes B. No

- 7. Would a stack or queue be more efficient for the following:
  - (a) [3 points] An undo button in a text editor

stack

Each action gets pushed onto the stack.(a)—— undo is simply popping actions off (b) queue

Handle requests in the order they arrive

(c) [3 points] A breadth-first search

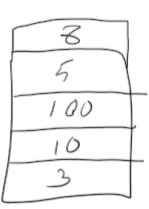

## store the nodes to visit in FIFO order (c) queue

store the nodes to visit in FILO order (d) Stack

[5 points] Given the following function mystery, determine its output assuming stack has had the following elements inserted in order: 3, 10, 100, 5, 8

```
int mystery(std::stack<int> stack) {
    int result = 0;
    int loop = stack.size(); 5

    for(int i = 0 ; i < loop; i++) {
        if(!(i % 2)) {
            result += stack.top();
        }
        else {
            result *= stack.top();
        }
        stack.pop();
    }
    return result;
}</pre>
```
